

DC Water Lead Water Pipe Replacement Program

Understanding what the DC Water Contractor will do in four steps.

This is what the DC Water Contractor will do:

- 1 Turn off the water service to your home for about eight (8) hours

- 2 Dig down near District water main, meter and property line and remove / abandon your lead water pipe from the watermain in the street, through your building wall or floor, to the pipe connection in your building.

- 3 Install a new **copper water pipe** from the District water main in the street to your building, through the wall where the pipe comes in and connect it to the water pipe in your building.

- 4 Turn on water, fill holes, restore area, and flush water from an outside hose connection, if possible.
